Earth's rotation is the rotation of planet Earth around its own axis. Earth rotates eastward, in prograde motion. As viewed from the north pole star Polaris, Earth turns counterclockwise. The North Pole, also known as the Geographic North Pole or Terrestrial North Pole, is the point in the Northern Hemisphere where Earth's axis of rotation meets its surface. This point is distinct from Earth's North Magnetic Pole. The South Pole is the other point where Earth's axis of rotation ...

Everything below the sphere of the moon is made of four elements: earth, water, air and fire. The natural motion of these elements is in rectilinear and radial. That is, the heavy elements naturally move down toward the center of the cosmos (which is the earth), and the lighter elements naturally move up. Further, each element has a natural

place. The natural place of the element earth is at the center of the cosmos. The natural place of water is just above the element earth. The natural ...

The motions of the Moon around the Earth and of the Earth around the Sun are complex. The motions involved in revolutions are superimposed on the movements involved in rotations. The Earth and the Moon both turn on their own axis (rotation), but both also move around another object (revolution). The rotation of the Earth (24 hours) explains the alternation of day and night.
