this gap by summarizing current accomplishments in preparing and characterizing nanoparticles and nanostructured films and to point out their potential applications. Versatility, relative ease of preparation and transfer from the liquid to the solid phase, convenience of scale-up, and economy are the advantages of the chemical

Corrosion processes in general can also be used to prepare nanostructured thin films, with a high level of control . In particular, nanostructured thin films of corrosion products, such as oxides can be prepared by subjecting a metal to a corrosion process. Such processes may, e.g., be employed after electrodeposition or PVD of a metallic structure, such that the corrosion process provides the nanostructuring of an otherwise prepared thin film. Indeed, such processes are employed in ...

Preparation of the nanocomposite films was accomplished according to the following steps as given in Fig. 1. First, 0.7 g of medium molecular weight (~450 KD) chitosan powder was dissolved in 50 mL of 1% v/v acetic acid under constant agitation for 2 h to form the chitosan-based homogeneous solution.

The synthesis of nanostructured surfaces and thin films has potential applications in the field of plasmonics, including plasmon sensors, plasmon-enhanced molecular

spectroscopy (PEMS), plasmon-mediated chemical reactions (PMCRs), and so on. In this article, we review various nanostructured surfaces and thin films obtained by the combination of nanosphere lithography (NSL) and physical vapor ...

Lipid nanoparticles (LNPs) have attracted special interest during last few decades. Solid lipid nanoparticles (SLNs) and nanostructured lipid carriers (NLCs) are two major types of Lipid-based nanoparticles. SLNs were developed to overcome the limitations of other colloidal carriers, such as emulsion ...
