

Control of Blood Sugar Levels

What hormones are involved in the homeostasis of blood sugar?

Why?

All living things use glucose as a source of energy. In vertebrates it is critical that the levels of glucose in the blood are constant. Small fluctuations are fine, but if the glucose concentration in the blood gets too high, a coma could result. If the glucose concentration in the blood gets too low, the person could experience severe seizures, go into a coma or die. In humans, hormone levels help regulate the glucose concentration in the blood and keep us in homeostasis.

Model 1 - Hormonal Control of Glucose

1. The relative blood concentrations of which three molecules are recorded in the graph of Model 1?
2. Which molecule from Model 1 is found in the blood at its highest concentration?
3. Why do cells need glucose?
4. According to the graph in Model 1, what happens to blood glucose levels after a meal has been eaten?

And this is the case for sugar, but this is something that you'll see often in chemistry, where you have a single unit, here's a single sugar, but if we talk in more general terms, we would call it a monomer. And then if we have a bunch of these monomers put together, we would call it a polymer. Now polysaccharides are super important, and you have probably eaten some polysaccharides today ...
