Findings showed that, as has been demonstrated in past research for overt aggression, individual differences in relational aggression were relatively stable over time. Additionally, relational aggression contributed uniquely to the prediction of future social maladjustment, beyond that predicted by overt aggression. Finally, prosocial behavior contributed unique information (beyond that provided by overt and relational aggression) to the prediction of future social adjustment.

The immediate concern of the extended model, like that of the original formulation, is the prediction of behavioral intentions (131) which are assumed to mediate overt behavior. According to the extended model, an individual's intention to perform a given act is a joint function of his attitude toward performing the act (A-act) and of his beliefs about what he is expected to do in that situation, i.e., his normative beliefs (NB). These normative beliefs are in turn multiplied by ...

The criterion to be predicted is BI, the behavioral intention. BI serves as an intervening variable between the three predictors and overt behavior. It is expected to account for most of the behavior variance, i.e., there should be a high correlation between BI and B and thus, according to the theory, if one can predict BI, one can also predict B with only a slight attenuation. This high correspondence between BI and B will, of course, only obtain if the BI selected by the experimenter is ...

Second, a user profile was constructed based on four aspects: demographic characteristics, telephonic communication behavior, cell-phone usage behavior, and

activity-travel behavior. Third, the prediction model that utilizes the AdaBoost algorithm was constructed to predict suitable BCTs for target users. Finally, the BCT-matching levels were calculated to generate the ranking of suitable ...

The relationship between attitudes and behavior has been the topic of considerable debate. This article reports a meta-analysis of 88 attitude-behavior studies that reveals that attitudes significantly and substantially predict future behavior (mean $r = .38$; combined $p < .000000000001$). Relatively large and significant moderating effects were found for the attitudinal variables of attitude ...

Moreover, effective behavior (entry/non-entry in the session) was taken into account. On the whole of the sample, 60,6% actually integrated the forecasted training course . The major results show that the model of the planned behavior is relevant insofar as the intensity of the intention predicts the behavior of integration. Various dimensions of the model act in differentiated ways: some of ...
